PROJECT OVERVIEW

Decisiq 360 is primarily a Financial Data Analytics and Decision Intelligence project, enhanced with AI.

It is an AI-powered financial intelligence platform designed to help organizations identify financial discrepancies, explain financial decisions, monitor risk exposure, and resolve month-end closing delays.

Financial data is often spread across multiple files and systems. When these records disagree, finance teams must manually investigate errors, understand their causes, and determine the appropriate actions. This process can be time-consuming, difficult to audit, and vulnerable to human error.

Decisiq 360 brings these workflows together through four independently functioning intelligence modules.

PROBLEM STATEMENT

Organization handling financial operations frequently face four major problems:

Problem 1: Financial Reconciliation

Financial records from different sources may contain mismatched amounts, missing transactions, duplicate entries, or inconsistent references. Identifying and resolving these exceptions manually delays reconciliation.

Problem 2: Financial Decision Explainability

A financial application may be declined or flagged, but the responsible team may struggle to communicate which rules, factors, or evidence influenced the decision.

Problem 3: Risk and Exposure Visibility

Financial figures distributed across multiple systems may conflict, making it difficult to understand an organization's actual exposure, identify unusual changes, and prioritize risks.

Problem 4: Month-End Closing Delays

Unresolved discrepancies, missing records, and dependent tasks can delay financial closing. Teams need visibility into blockers, their potential impact, and the actions required to resolve them.

PROPOSED SOLUTION

Decisiq 360 provides four independent modules:

1. **Reconciliation Intelligence:** Compares financial records, detects discrepancies, categorizes exceptions, and identifies potential root causes.
2. **Decision Intelligence:** Explains financial decisions through relevant factors, applicable rules, and supporting evidence.
3. **Risk & Exposure Intelligence:** Identifies conflicting financial figures, calculates exposure using defined rules, and highlights risk drivers.
4. **Close Intelligence:** Tracks closing tasks, identifies blockers and dependencies, and estimates their financial or operational impact.

Each module has its own processing logic and results interface while sharing common data ingestion, validation, storage, and security services.

HOW THE SOLUTION WORKS

1. **Step 1 — Data ingestion:** The user uploads supported financial files containing public or synthetic data.
2. **Step 2 — Validation:** The system checks file structure, required fields, data types, missing values, and potential duplicates.
3. **Step 3 — Data preparation:** Records are standardized into appropriate analytical schemas and loaded into Exasol Personal.
4. **Step 4 — Intelligence processing:** The selected module runs its own analysis using SQL queries, deterministic rules, statistical methods, or AI-assisted reasoning where appropriate.
5. **Step 5 — Investigation:** The application displays detected issues, relevant evidence, possible causes, confidence or severity indicators where justified, and recommended next actions.
6. **Step 6 — Resolution and reporting:** Users can review findings, track their status,

and export supported reports.

TECHNICAL ARCHITECTURE

Modular by design. Auditable by default.

The proposed architecture consists of four layers.

Layer 1: User Experience

- File upload.
- Module selection.
- Results visualization.
- Exception investigation.
- Report generation.

Layer 2: Independent Module Services

- Reconciliation Intelligence.
- Decision Intelligence.
- Risk & Exposure Intelligence.
- Close Intelligence.

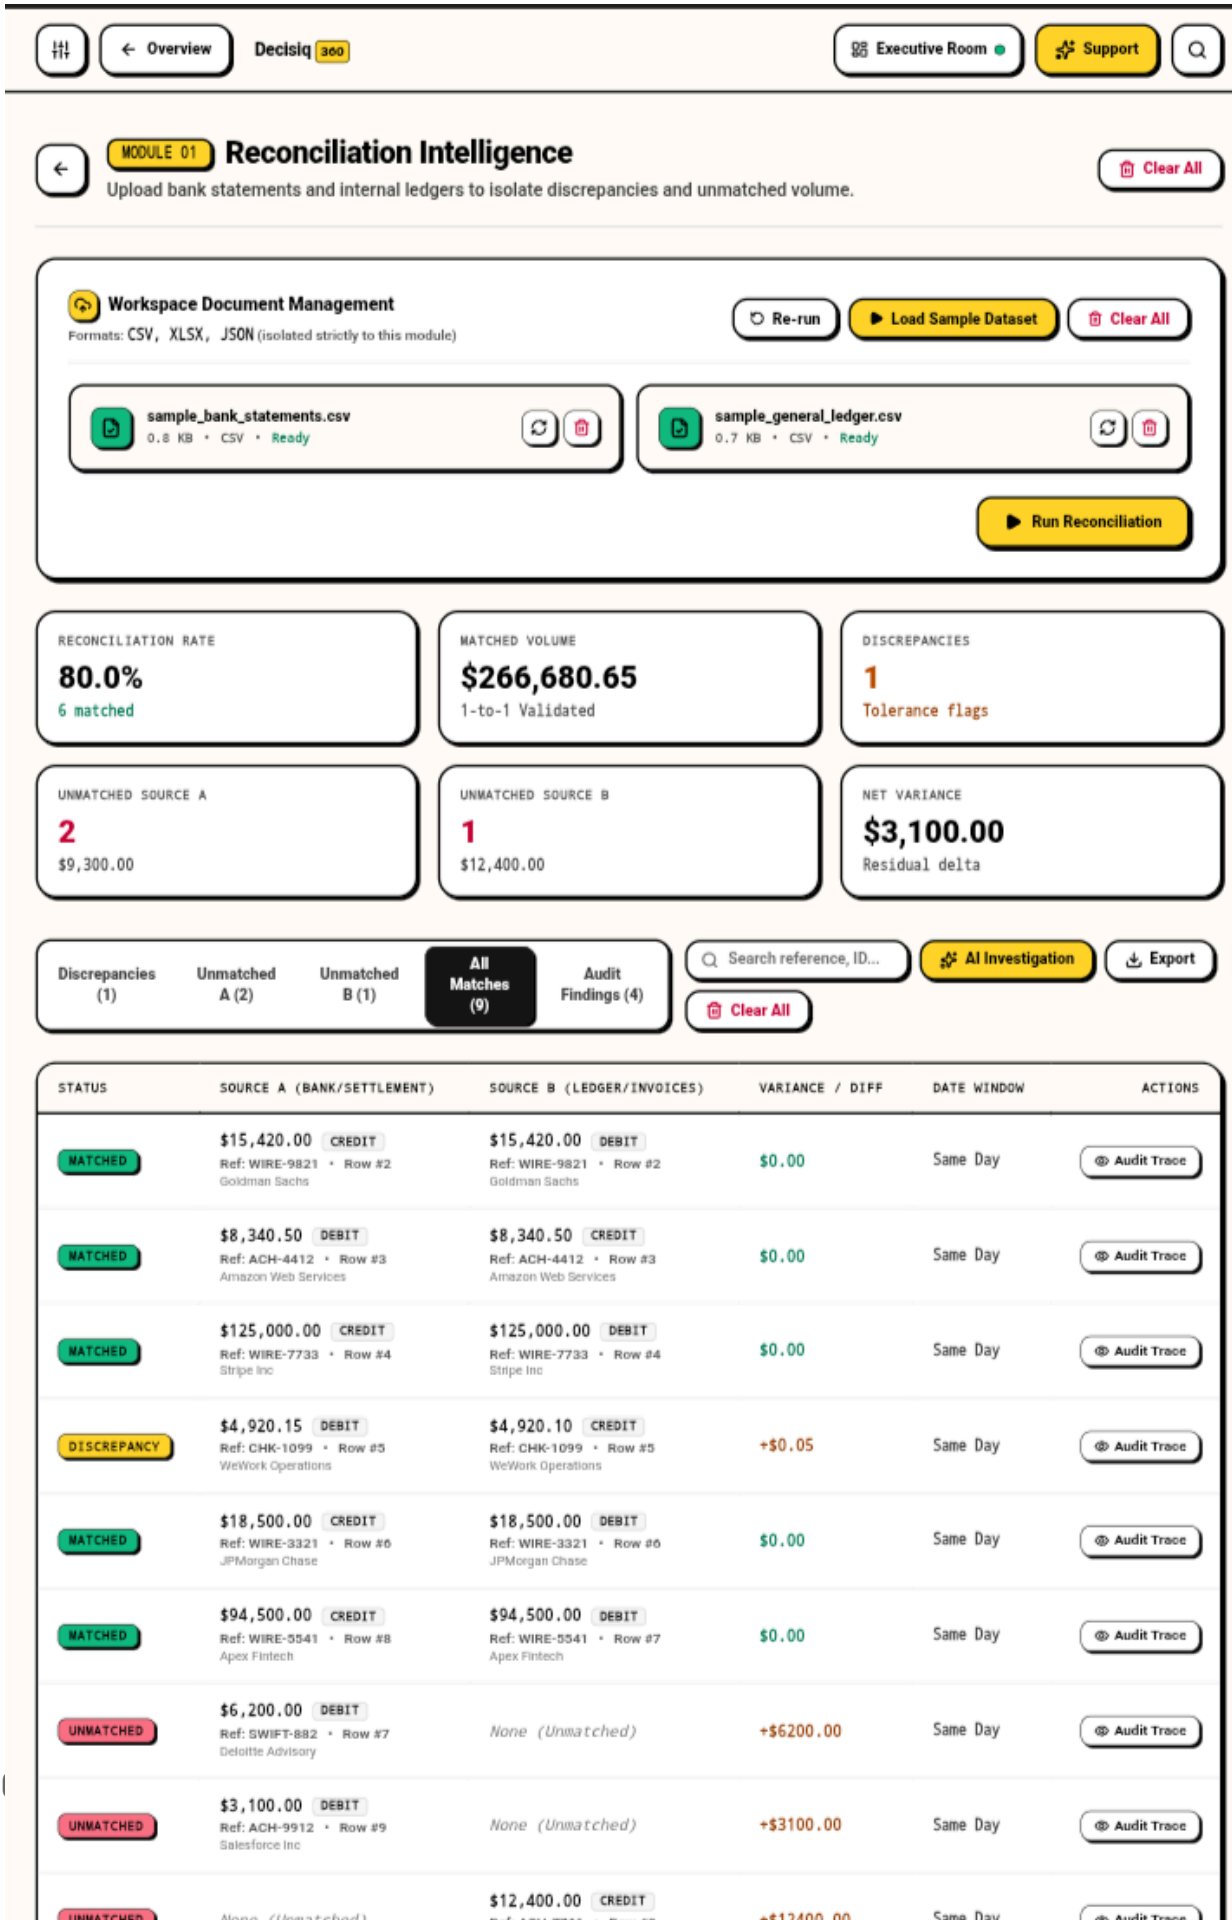

Layer 3: Shared Processing Services

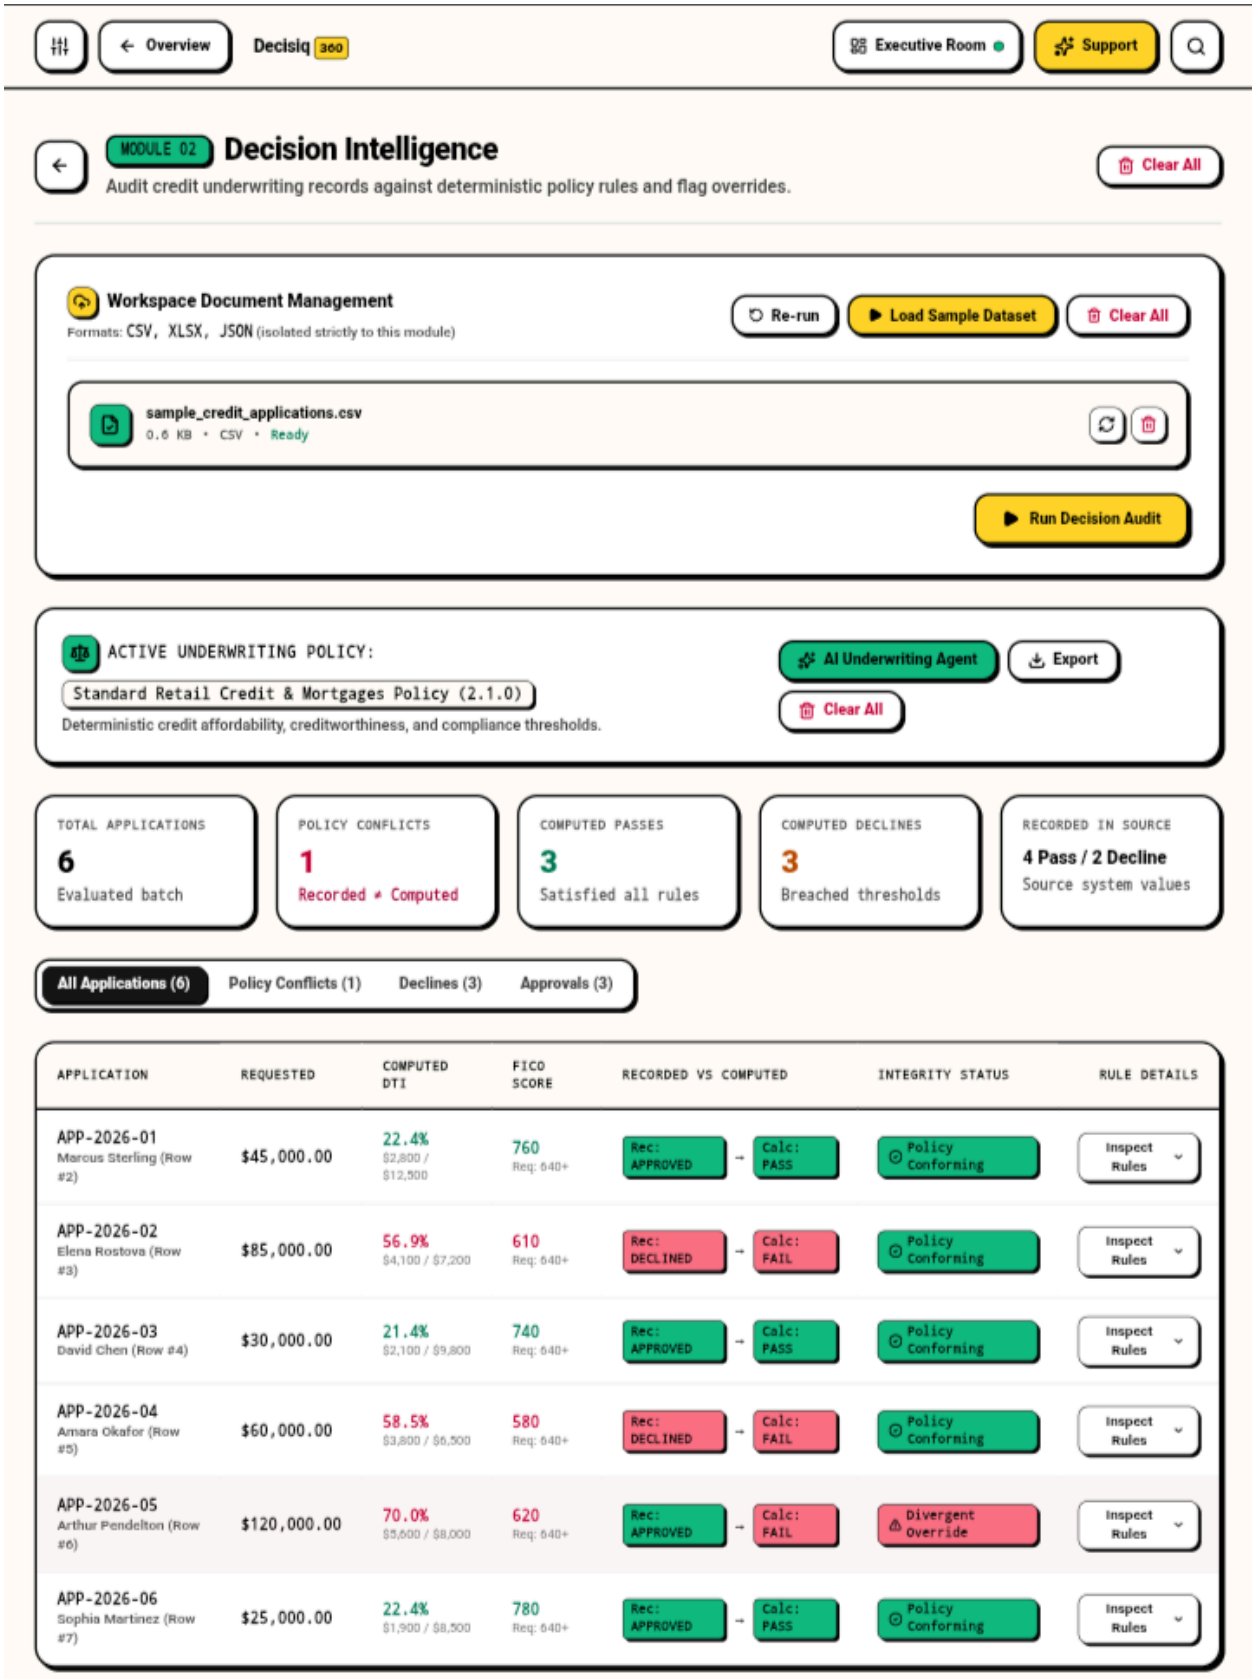

- File validation.
- Data normalization.
- Business rules.
- Investigation logic.
- Evidence logging.

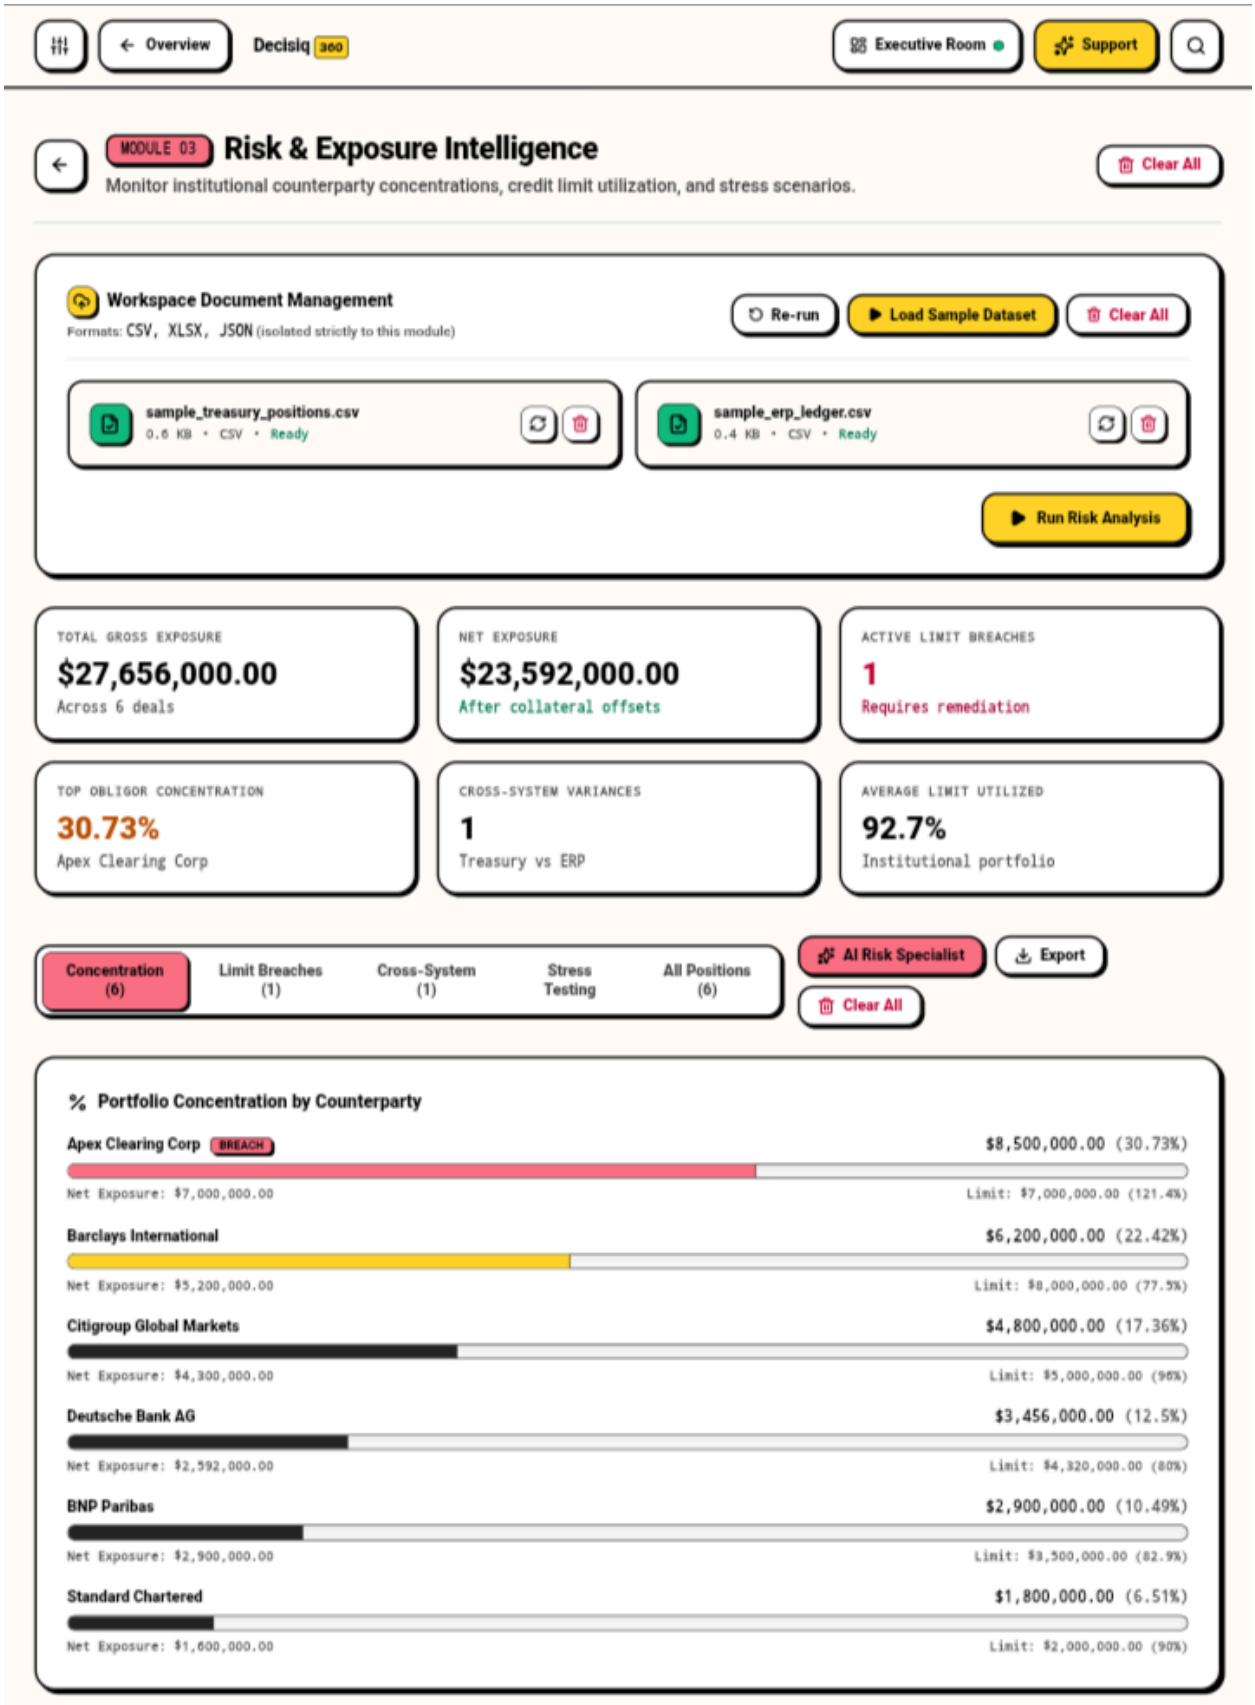

Layer 4: Analytical Data Platform

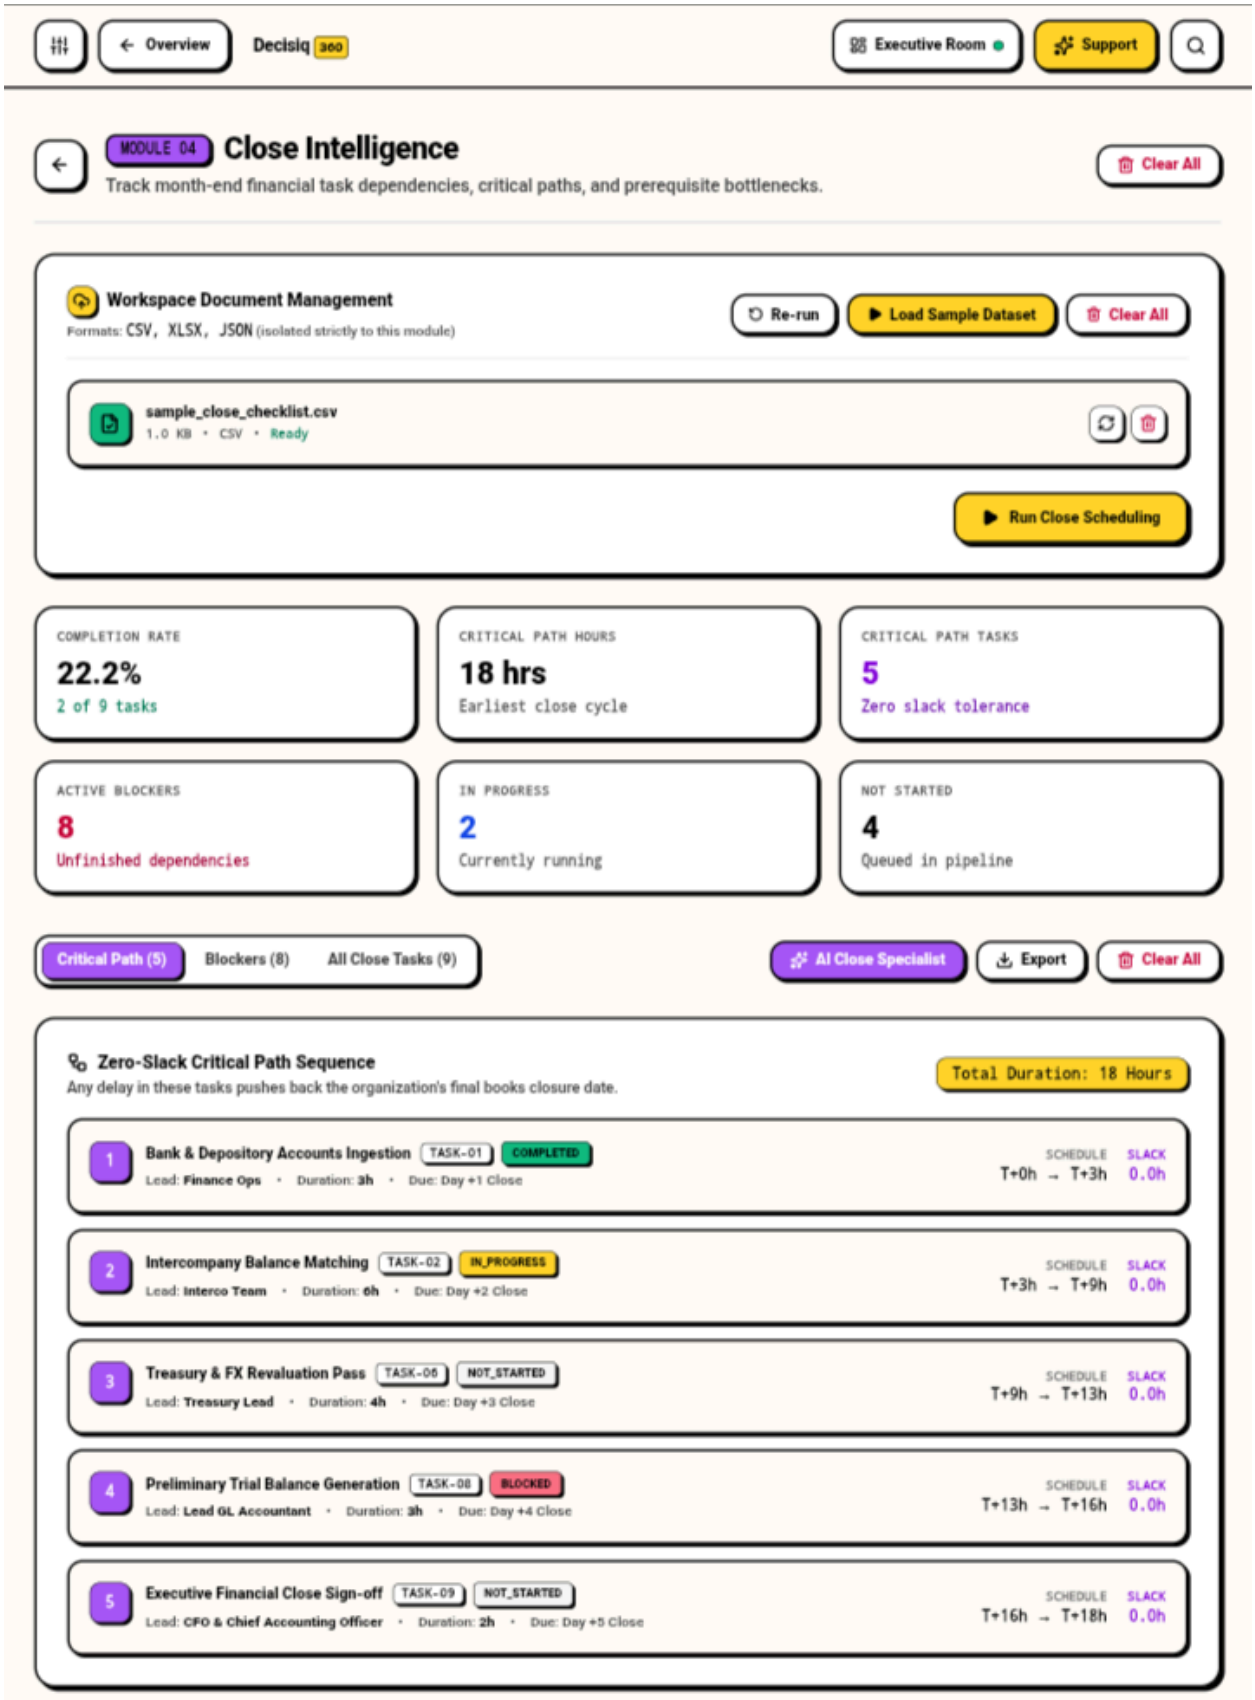

- Exasol Personal.
- Database schemas.
- SQL queries.
- Aggregations and analytical processing.

EXPECTED IMPACT

Decisiq 360 aims to help finance teams:

- Reduce manual investigation of financial exceptions.
- Identify discrepancies earlier.
- Make financial decisions easier to explain and audit.
- Improve visibility into risk and exposure.
- Identify bottlenecks in financial closing.
- Make decisions based on traceable evidence rather than unexplained AI outputs.

Actual improvements in speed, accuracy, and resolution time will be measured during testing rather than assumed in advance.

DATA, SECURITY, AND RESPONSIBLE AI

1. The project will use only public or synthetic datasets. No employer data or proprietary competitor materials will be used.
2. Financial findings will be supported by traceable records, SQL results, or explicit decision rules wherever possible. AI-generated explanations will be clearly distinguished from verified facts. The system will not claim that a suspected root cause is confirmed unless sufficient evidence supports it.
3. Credentials and sensitive configuration values will not be committed to the public repository.
4. The project is also capable of working in a sandbox environment.

PRIVACY AND SECURITY

Privacy is a product requirement, not an optional enhancement.

Offline-first: local functionality must not depend on a cloud connection unless a feature explicitly requires one.

Explicit online consent: internet availability must never automatically enable cloud analysis or telemetry that transmits user data.

Transparent disclosure: state which provider receives data, what fields or files are sent,

why they are needed, and whether the provider may retain them.

Data minimization: send only the minimum necessary information; prefer local processing and redaction.

Secure file handling: validate uploads, reject unsupported content, prevent path traversal, and use safe temporary-file handling.

Secrets: never commit API keys, tokens, passwords, private datasets, or environment files containing secrets.

Access control: if multi-user functionality exists, enforce authorization on the server or trusted backend, not only in the UI.

Storage: document where files, derived results, logs, and settings are stored and how they are protected.

Deletion: a clear/reset action should remove the selected module's stored uploads, results, and derived artifacts within its stated scope. Ask for confirmation when deletion is destructive.

Logging: avoid logging file contents, credentials, or sensitive personal data.

AI safeguards: treat uploaded text and files as untrusted data, not as instructions to override application rules.

User-facing explanations: explain limitations and require human review for consequential decisions.
